How Do We Generate I Can and We Can Statements?

Now we turn our attention to how we develop I can or We can statements. These statements come from the deconstruction of the learning intention. In other words, what are the necessary components or steps that lead to the learning intention? Return to the image of the target in Module 1 (see Figure 1.1 on page 17). Notice that each success criterion moves learners closer to the bull’s-eye or targeted learning intention. As we pointed out earlier, there are often multiple success criteria for each learning intention. This is how we should generate success criteria. Consider the following examples.

**Learning Intention:**
We are learning the many ways mathematicians make sense of and represent quotients and remainders.

**Success Criterion 1:** We can select a strategy and solve for a quotient and remainder.

**Success Criterion 2:** We can represent the quotient and the remainder using equations, rectangular arrays, or area models.

**Success Criterion 3:** We can explain the meaning of the quotient and the remainder within the representation and the problem context.

**Success Criterion 4:** We can compare our reasoning to a peer’s and analyze differences and similarities in our strategies and representations.

**Learning Intention:**
I am learning that animals behave in different ways to survive in their habitats.

**Success Criterion 1:** I can list different animal behaviors.

**Success Criterion 2:** I can describe how animals gather food, find shelter, defend themselves, and rear their young.

**Success Criterion 3:** I can use evidence to infer how these behaviors help animals to survive.

**Success Criterion 4:** I can construct an explanation for why specific behaviors depend on specific habitats and environments.

**Learning Intention:**
I am learning how to integrate information from two texts into my writing.

**Success Criterion 1:** I can extract key details from texts.

**Success Criterion 2:** I can identify places of agreement and disagreement in the texts.

**Success Criterion 3:** I can use the information from my analysis in my writing.
In these examples, the success criteria not only move learners closer to the targeted learning intention, but they also move toward a higher level of complexity or greater depth of knowledge. In the math example, a similar progression from solving and representing to explaining and analyzing emerges as learners move closer to the target. In the science example, listing different animal behaviors requires a different level of thinking than constructing an explanation about specific behaviors in specific habitats. In the English language arts example, students move from identifying details to comparing those details to integrating them into their written responses. And in social studies, learners should progress from describing the contributions of Muslim scholars to analyzing and evaluating their impact on later civilizations.

When we deconstruct the learning intention to generate success criteria, we should develop a pathway for the learner that guides them toward the bull’s-eye. This progression begins with a foundational idea (e.g., division problems can have quotients and remainders, animals have behaviors, text structures, general contributions of Muslim scholars), then moves to multiple ideas (e.g., quotients and remainders can be represented in multiple ways, animals have specific behaviors, text structures provide information, Muslim scholars contributed to science and medicine). From there, the progression should move learners toward relational thinking and then application of the concept and thinking (e.g., construct an explanation, justify a strategy, use text structures to organize notes, evaluate or analyze the impact of Muslim scholars). Like hitting a target, you only get some of the “points” if you hit one of the outside circles. When you hit the bull’s-eye, you get all of the “points”; in this case, you have met all of the success criteria.
